

(a) A learned connection is a paired memory

forward history $h_a^{(\ell-1)}$

clock $\xi \in [0, \tau]$

$\bar{h}_{a,0} \bar{h}_{a,1} \bar{h}_{a,2}$

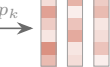

fixed basis p_k ,
moving n -vectors

backward history $r_a \delta_a^{(\ell)} / \rho$

clock $\xi \in [0, \tau]$

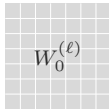

$\bar{\delta}_{a,0} \bar{\delta}_{a,1} \bar{\delta}_{a,2}$

pair

$\sum_{a,k} (2k+1)$
 $\bar{\delta}_{a,k} \bar{h}_{a,k}^\top$

kept, fixed

$\widehat{W}^{(\ell)}$

rank $\leq mP$

(b) Why pairing helps

$\int b h^\top$ splits into four pairings

	$\Pi_P h$	$h - \Pi_P h$
$\Pi_P b$	kept memory	0
$b - \Pi_P b$	0	defect omitted $\times$ omitted

mixed terms vanish by orthogonality

feedback
stability

trajectory error $O_T(P^{-1})$ or $O_T(P^{-2})$

responses of the reconstructed network feed the next memories
