

Two outliers, alternating

Dense network
reference predictor

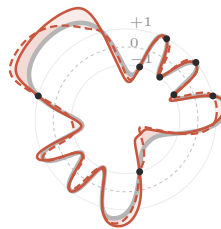

reference

Frozen NTK
initial kernel, all blocks

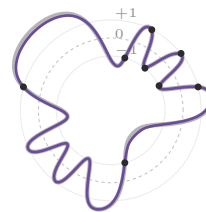

RMS 14.48
output scale $\times 10$

Trained factors
 $W_0 + AB$, rank 24

RMS 0.4655 / 0.4609
two seeds: solid / dashed

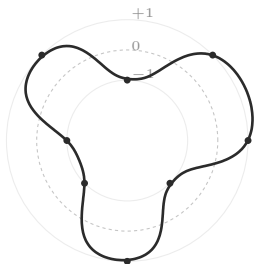

Response memory
 $q = 3$, rank bound 24

RMS 0.07295

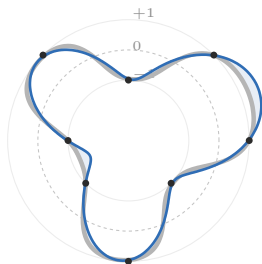

Equally spaced, mixed

Dense network
reference predictor

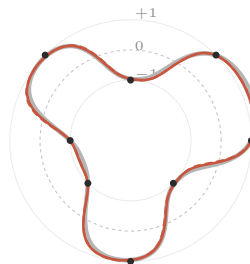

reference

Frozen NTK
initial kernel, all blocks

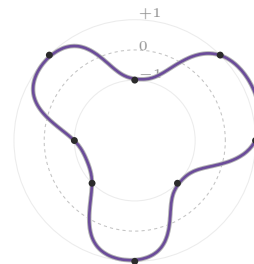

RMS 0.1498
same output scale

Trained factors
 $W_0 + AB$, rank 12

RMS 0.06069 / 0.06871
two seeds: solid / dashed

Response memory
 $q = 3$, rank bound 12

RMS 0.0005257

— dense reference

• training labels

Same initialized network; each model at training MSE $\simeq 0.001$, at its own fitting time.

RMS differences from dense use 8192 circle queries. Signed ticks give output values; any wider NTK scale is marked explicitly.
