

The frozen kernel fits the labels but selects a different function

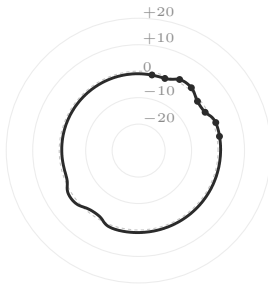

Frozen NTK

$K(t) = K(0)$, all parameter blocks

RMS from dense 13.69
output range $[-25.34, 25.34]$

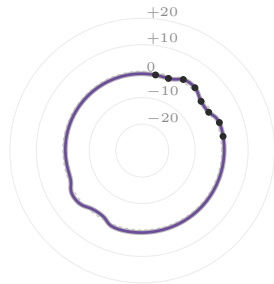

Dense network reference predictor

— dense reference
• training labels

Response memory

$P = 3$

RMS from dense 0.00282
dense and memory stay near ± 1.27

Same initialization, canonical learning rates, eight training points and training MSE 0.001.
All panels use the same linear radial scale: $30 + f(\theta)$; ticks show signed output. RMS uses 8192 queries.
