

Same training fit, different predictions between samples

Trained factors

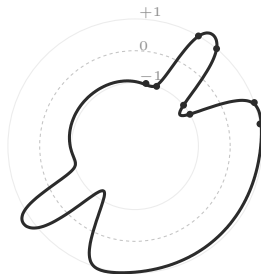

$W_0 + AB$, rank 24

— seed 1: RMS 0.375
- - - seed 2: RMS 0.204

Dense network

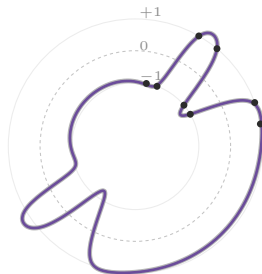

reference predictor

— dense reference
• training labels

Response memory

$P = 3$, rank bound 24

RMS 0.00282
almost coincides with dense

Every model reaches training MSE 0.001 on the same eight points.
RMS compares fitted predictions with dense on 8192 circle queries; radius is $3 + f(\theta)$.
